EXPERIENCE RELEVANT TO DBS

Investment, operations and delivery

Three enterprise platforms and operating transformations mapped directly to the DBS mandate.

01 / FRASERS

Platform transformation

S$5.5m Project Meta & Adobe Cloud

Deployed Adobe Experience Cloud (AEM, Analytics, Launch, Target); managed API requirements with Sabre CRS and Cendyn CRM; in-housed Google/Meta into 7-FTE CoE; delivered +56% YoY website room night growth.

DBS application

Translate marketing needs into technical solution designs, API requirements, event schemas, prioritized backlogs, and joint production sign-offs.

02 / ACCOR

Regional governance

Search Desk & Agency In-Housing

Named regional authority for corporate search accounts, APAC-based budgets, and Kenshoo technology handoffs across 600+ hotels in 17 markets; restructured agency model to cut fees from 18% to 13% (~US$1.4M annual savings).

DBS application

Establish DBS-owned account hierarchies, least-privilege RBAC, repeatable AdOps SLAs, and clear handoff boundaries between internal teams and agencies.

03 / HOMEAWAY & TRIPADVISOR

Performance & Engineering

US$15m+ Remit & Technical Coordination

Directed US$15M+ media and BidTarget ML bidding at HomeAway; resolved mobile attribution defects (Kochava). Coordinated campaign feeds, dynamic URL parameter routing, and Python/MySQL automation with engineers at TripAdvisor.

DBS application

Bridge marketing with software engineering; enforce deterministic conversion signals, automated bidding, and high-velocity incrementality testing.

Platform boundary: CDP was designed and advanced to RFP; not deployed in production. ML models operated in cross-functional partnership with Data Science pods.

PROPOSED ARCHITECTURE · TO VALIDATE WITH DBS

Own the platform and its controls

End-to-end signal integrity, owned infrastructure, and banking-grade governance.

01 / DEFINE

Business outcome

Agree the qualified conversion, value tiers, exclusions and measurement window with business units and Analytics.

02 / GOVERN

Data & access

DBS account ownership, least-privilege RBAC, consent validation, and zero-PII egress payloads under PDPA & MAS TRM.

03 / ACTIVATE

Integration

Platform API mappings (Google Ads, Meta CAPI, LinkedIn CAPI), audience synchronization, and creative metadata tagging.

04 / MEASURE

Closed-loop analytics

Reconcile events to core transaction records; separate attribution from incrementality and monitor signal health.

AdTech product delivery responsibility

Own the product brief, event schema contracts, acceptance criteria and backlog. Review payloads and failure cases with engineering; agree production readiness with Technology and Data.

Every release needs a control pack

Authentication and scopes · deduplication and retry behaviour · freshness and error alerts · launch QA · rollback · incident owner · approved creative and AI-content review.

Channels: Google · Meta · LinkedIn · TikTok · approved programmatic.

FIRST 90 DAYS · PROPOSED DELIVERY PLAN

Establish ownership. Prove one use case.

A structured sequence: baseline audit, synthetic prototyping, bounded pilot, and a funded scale gate.

DAYS 1–30

Diagnose & agree

- Inventory accounts, access, contracts, tags, feeds and conversion definitions.
- Map agency/market responsibilities and delivery cost baselines.
- Select one priority banking product, market, channel and permitted outcome.

Output
Baseline audit, risk register, ownership matrix and pilot charter.

Gate: sponsor, data governance, and pilot scope approved.

DAYS 31–60

Specify & prototype

- Write event schema contracts, API mappings (Google, Meta, LinkedIn), and NFRs.
- Test in staging with synthetic data; validate deduplication, retries and exclusions.
- Set creative metadata taxonomy, QA protocols and incident procedures.

Output
Demonstrable prototype and test evidence against acceptance criteria.

Gate: joint Technology, Data and control-owner review.

DAYS 61–90

Pilot & decide

- Run a budget-capped pilot; reconcile events against approved banking outcomes.
- Check event reconciliation, signal latency, spend control and match rates.
- Formulate capability transfer playbooks and internal AdOps runbooks.

Output
Pilot readout, operating runbook and funded six-month roadmap.

Gate: expand, refine, or stop based on empirical evidence.

Working sequence; access, staffing and approvals determine release timing.

No assumed DBS baseline or promised uplift.

Scale what earns the right to scale

MONTHS 4–6

Make the pilot repeatable

- Expand validated API connectors and audience use cases market by market across APAC.
- Bring repeatable QA, reporting and trafficking controls in-house; retain agency surge capacity.
- Deploy server-side conversion feedback loops (CAPI) and audience suppression feeds tied to core ledger.

MONTHS 7–12

Add intelligence with accountability

- Evaluate predictive LTV signals with Data Science: labels, leakage, drift, calibration and holdouts.
- Deploy generative AI for creative variants and localization with mandatory human review.
- Enforce automated bidding guardrails: hard spend ceilings, anomaly alerts, immutable audit logs, and kill switches under MAS FEAT and DBS PURE frameworks.

The unified scorecard I would own

Control: zero unmanaged accounts, launch defect rate, audit trail compliance · **Signal:** match rate (>98%), latency, core ledger reconciliation
Delivery: release lead time, internal SLAs, total cost to serve · **Value:** CAC per qualified customer, verified incremental portfolio contribution

The goal: an internal capability that protects customer trust, commands data sovereignty, and accelerates digital growth across DBS markets.
